

Muscle function analysis

Detecting disbalances - optimizing training

Muscle function analysis is used to check muscle function or the muscular power of individual muscles or muscle groups. It provides information about damage to the peripheral motor nerves, the capability and the healing process of functionally or organically injured muscles.

Your benefits:

Muscle function analysis provides valuable information for planning training, both for athletes and for the everyday life of a normal patient. Regular diagnostics are important, especially for the follow-up of muscle damage.

Areas of application:

- Sports injuries
- Longer periods of immobilization (confinement in bed, plaster cast immobilization)
- Follow-up as part of therapeutic muscle training.
- Postural weakness
- Limited mobility
- Optimization of training for your sport
